

eParcVal®

Online Validation Solution

Attract patrons to your parking facility to attain maximum occupancy with discounts made available through flexible validated parking. Amano McGann's eParcVal allows facility management to set customized validations that give valid users the ability to apply a validation to an individual customer's entry ticket.

eParcVal seamlessly integrates with Pro+ Parking Management Software to allow patrons hassle-free, discounted parking. The facility owner or operator is able to generate comprehensive reporting that makes tracking validated tickets simple. Upon exit, patrons insert their validated parking ticket into the revenue control device for automatic validation recognition. Amano McGann's eParcVal can be used with the OPUSeries line of products for a simplified, easy validation process.

Features

- Web based application
- Apply validations directly to the patron's entry ticket to be used at the exit
- Customized validations for multi-tenant/multi-store facilities
- Apply up to 3 validations per ticket
- Consolidated reporting for superior control

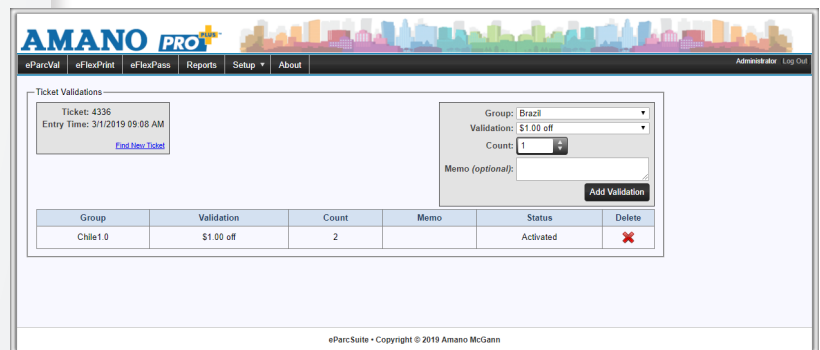

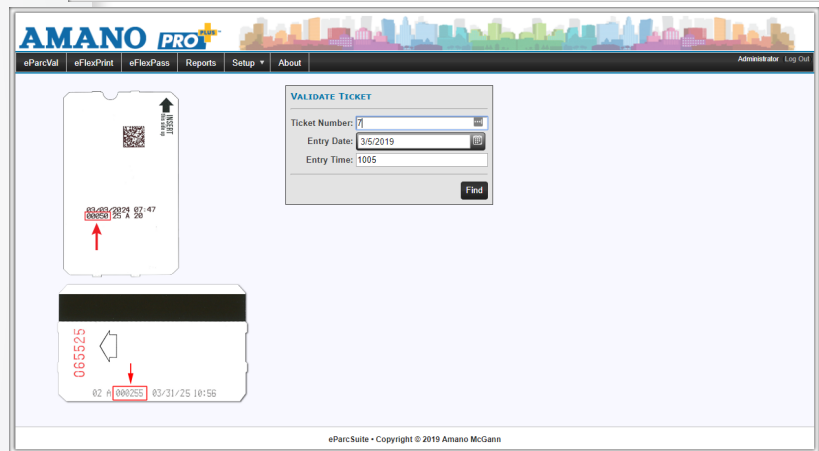

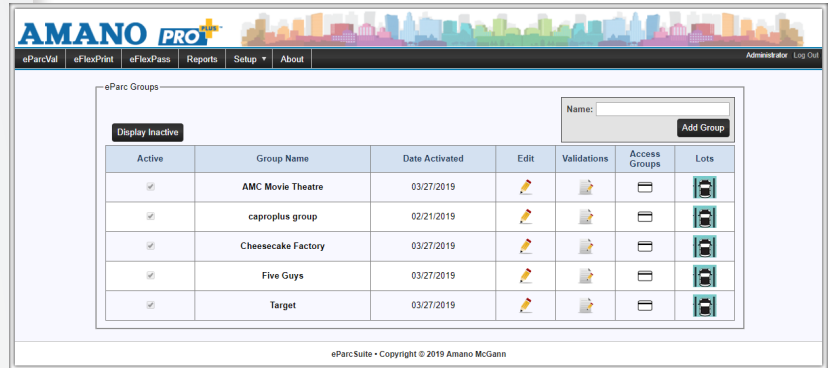

Discounted Parking Made Easy Online Validation Process:

1. The system administrator/facility operator logs into the system to create validations for multiple user groups or tenants whose patrons use the parking facilities. The operator sets the validation number and value, and assigns the validation to specific user groups
2. The patron presents the entry ticket to an eParcVal user. The user enters the ticket number, entry date, and entry time for Pro+ to locate and verify the validity of the ticket. The user can then select the validation(s) to apply to the patron's ticket, and return the entry ticket to the patron for use at the exit.
3. Upon exit, the patron inserts the validated entry ticket into the exit device. The system software applies the correct validation, displays the discounted fee and prompts patron to pay any remaining balance.

Reporting Capabilities

The eParcVal platform automatically tracks validations and has the ability to generate reports to keep operators in the know at all times. The system's reporting capabilities include: active validations, expired validations, validations by user, and validations by option such as start date, end date, created date, group and validation value.

Benefits:

- Full validation control
- Audit reporting
- The patron only needs to keep track of one ticket to enter and exit the facility
- Program multiple validations per user group
- Track multiple user groups through one program
- Enable/disable validations from any location with internet access
- All entered validations are tracked to prevent unauthorized reuse
- Fast, easy validation process improves customer service
