CVPS

Casino Management System Interface

Seamlessly provide players with discounted valet parking and streamline the valet process for your team. CVPS integrates with the most widely used CMS including Aristocrat Oasis 360, Ballys ACSC, Ballys CMP, IGT, Konami, LMS, and more.
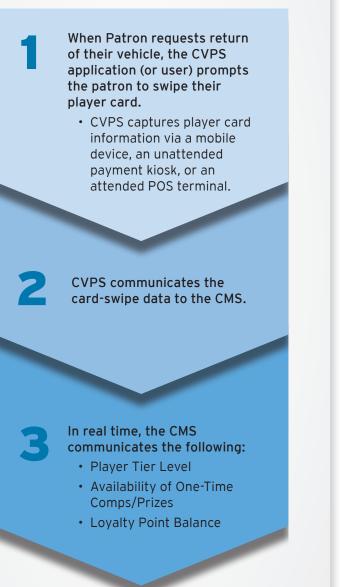

CVPS will:

- Check the patron's tier level against the business rules to determine applicable discount
- Display the available point balance and the number of points required to pay for parking
- Determine if the request should be assigned a higher priority based on tier level
- CVPS is also able to require input of a PIN number to authorize point redemption
- CVPS can control access to gated parking nests or pedestrian doors based on the player tier level

Players Club Programs facilitated by Casino Management Systems (CMS) drive loyalty and excitement on the casino floor. Now you can extend that energy to the valet stand!

The Process

1 When Patron requests return of their vehicle, the CVPS application (or user) prompts the patron to swipe their player card.

- CVPS captures player card information via a mobile device, an unattended payment kiosk, or an attended POS terminal.

2 CVPS communicates the card-swipe data to the CMS.

3 In real time, the CMS communicates the following:

- Player Tier Level
- Availability of One-Time Comps/Prizes
- Loyalty Point Balance

Business logic within the CVPS interface is user-defined. You are in complete control and determine how to treat various tier-level scenarios.
